
Containers & Public Clouds

Lab. 4

Outline

- Compare performance of containers with Xen
- Use docker
- Deploy in Amazon EC2 a complex workload

Task1: LXC (33%)

- Using LXC repeat task 3 of Lab 3
 - For simplicity desired “SLA” is 75%
- Figure out how to mimic scheduling policy in LXC

Task2: Docker (33%)

- Deploy SpecWeb* in 3 docker container (webserver, client, BeSim) using incremental images
 - Feel free to use any approach to the initial container (use other distro, use official apache or nginx dockers, ...)
- Run the benchmark and compare with "best" Xen
- Upload the containers to dockerhub "privately"

Task 3: GCE/Amazon EC2 (33%)

- Deploy the containers created in Task 2 in separate AMI in Amazon EC2 or Google Compute Engine
- Measure performance
